## Table of contents

# Basics of Javascript

Now we have a button and a style, but no way to format it. When wanting to move the elements around the page, we can use a style sheet!

# My Button Component Home

```
export default function Home() {  
  return (  
      
    <img src=  
      "https://image.petmd.com/files/styles/863x625/p  
    </>  
  );  
}
```

# Basics of Classnames

We can add a classname to our HTML tag to add a stylesheet to it

# My Button Stylesheet

```
/* In your CSS */  
.avatar {  
  border-radius: 50%;  
}
```

```
export default function Home() {  
  return (  
       
    <img className="avatar" src="https://image.petm  
    </>  
  );  
}
```
